WordPress is driven by a MySQL database. This is something active WordPress users would know. However, if you only just read about it here from us, here's what you should know. MySQL is a **free relational database management system** available in most web hosting services. All of the WordPress data like the posts, comments, categories, and settings are stored within the MySQL database. If you wish to read up more about MySQL, you can take a look at [WordPress's Database Schema](#).

For example, if you needed to change some information across the board in WordPress, going through each record is very time consuming and prone to human error. By simply executing a SQL query against your WordPress database, you can make the necessary changes quickly and efficiently.

Shown below are some SQL queries that can be of great assistance to you when using WordPress.

Backup your WordPress Database

Before you proceed with any changes, be sure to **backup your database**. It is a good practice to always backup your database before making any major changes. This ensures that even if anything were to go wrong, you would still be able to restore it.

You can download [WP-DB-Backup](#) or [WP-DBManager](#) plugin to backup your database through your WordPress admin panel. Alternatively, you can backup your database through phpMyAdmin manually.

If you decide to backup your WordPress database manually, follow these steps:

1. Login to your **phpMyAdmin**.

Get the latest updates on new design and development resources for free!

7. Choose compression type, select **gzipped** to compress the database to a smaller size.
8. Finally click Go, and a download window will prompt you to save your backup database file.

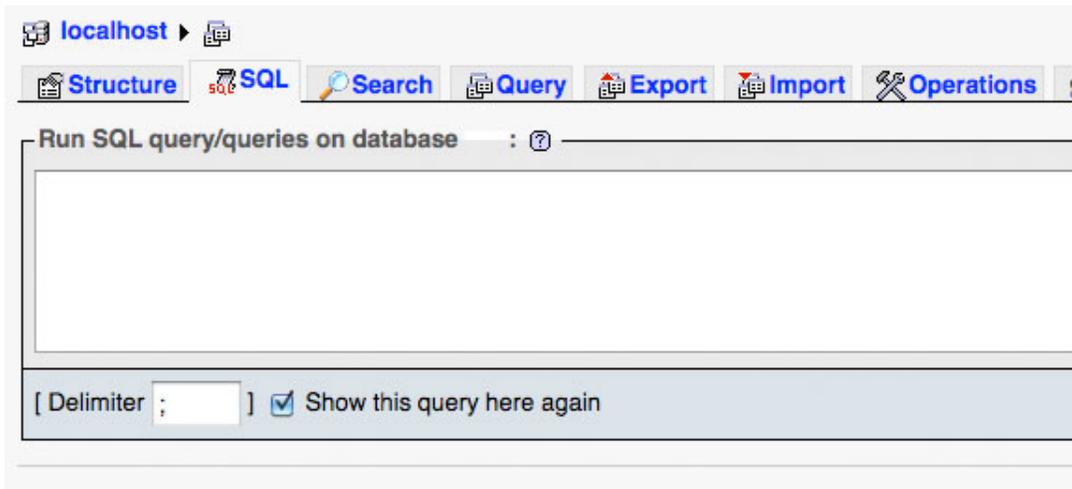

13 SQL Queries for WordPress

An easy way to run any of the queries below is to use phpMyAdmin. phpMyAdmin is one of the most common database look-up and editing tool. Almost all the web hosting services' control panels provide this. There is also [WordPress SQL Executioner](#) - a WordPress plugin that allow you to execute your SQL query.

To use phpMyAdmin follow the steps below:

1. **Login to phpMyAdmin** panel and select your WordPress database.
2. Click on the SQL tab which will bring you to a page with a **SQL query box**.

Once you see the SQL query box, like the image shown below, you can run your SQL query there.

Note: All queries are direct SQL queries and will assume the standard table prefix 'wp_' for tables. If you are using a different table prefix, please modify queries accordingly.

Change Siteurl & Homeurl

WordPress stores the absolute path of the site URL and home URL in the database. Therefore, if you transfer your WordPress site from the localhost to your server, your site will not load online. This is because the absolute path URL is still pointing to your localhost. You will need to change the site URL and the home URL in order for the site to work.

Solution:

```
1 | UPDATE wp_options SET option_value = replace(option_value, 'http://www.oldsiteurl1..
```

Change GUID

After you have migrated your blog from the localhost to your server or from another domain to a new domain, you will need to fix the URLs for the GUID field in wp_posts table. This is crucial because GUID is used to translate your post or page slug to the correct article absolute path if it is entered wrongly.

Solution:

Get the latest updates on new design and development resources for free!

WordPress uses absolute path in the URL link instead of a relative path in the URL link when storing them in the database. Within the content of each post record, it stores all the old URLs referencing the old source. Therefore you will need to change all these URLs to the new domain location.

Solution:

```
1 | UPDATE wp_posts SET post_content = REPLACE (post_content, 'http://www.oldsiteurl.co
```

Change Image Path Only

If you decide to use Amazon CloudFront as your Content Delivery Network (CDN) to offload the delivery of images from your server. After you have created your CNAME record, you can use the query below to change all the image paths in WordPress to load all your images from Amazon CloudFront.

Solution:

```
1 | UPDATE wp_posts SET post_content = REPLACE (post_content, 'src="http://www.oldsite
```

You will also need to update the GUID for Image Attachment with the following query:

```
1 | UPDATE wp_posts SET guid = REPLACE (guid, 'http://www.oldsiteurl.com', 'http://yo
```

Update Post Meta

Updating Post Meta works almost the same way as updating the URL in post content. If you have stored extra URL data for each post, you can use the follow query to change all of them.

Solution:

```
1 | UPDATE wp_postmeta SET meta_value = REPLACE (meta_value, 'http://www.oldsiteurl.co
```

Change Default "Admin" Username

Every default WordPress installation will create an account with a default Admin username. This is wide spread knowledge, everyone who uses WordPress knows this. However, this can be a security issue because a hacker can brutal force your WordPress admin panel. If you can change your default "Admin" username, you will give your WordPress admin panel additional security.

Solution:

```
1 | UPDATE wp_users SET user_login = 'Your New Username' WHERE user_login = 'Admin';
```

Reset Password

Ever wanted to reset your password in WordPress, but cannot seem to use the reset password section whatever the reason?

Solution:

Get the latest updates on new design and development resources for free!

If you want to transfer the articles under Author B to merge with those under Author A, it will be very time consuming if you do it article by article. With the following SQL query, you can easily go through all the records and assign articles by Author B to go under Author A.

You will first need to obtain the author ID of both authors by going to your **Author & User** page in your WordPress admin panel. Click on the **author's name** to view their profile. At the address bar, look for "**user_id**". That is the author ID information we require.

Solution:

```
1 | UPDATE wp_posts SET post_author = 'new-author-id' WHERE post_author = 'old-author-:
```

Delete Revision

When you are editing an article in WordPress, there will be many revision copies being saved. This is a waste of resources because excessive revision records can increase the burden of the database. Over time, when you have thousands of entries, your database will have grown significantly. This will increase loop iterations, data retrieval and will affect the page loading time.

Solution:

```
1 | DELETE a,b,c FROM wp_posts a
2 | LEFT JOIN wp_term_relationships b ON (a.ID = b.object_id)
3 | LEFT JOIN wp_postmeta c ON (a.ID = c.post_id)
4 | WHERE a.post_type = 'revision'
```

Source from: [Lester chan](#)

Note: Bear in mind that all revisions from each post will be deleted, including all of its meta data.

Delete Post Meta

Installing or removing plugins is a very common task for WordPress. Some of the plugins make use of the post meta to store data pertaining to the plugin. After you have removed the plugin, those data are still left inside the **post_meta table**, which will no longer be needed. Run the following query to clean up the unused post meta value. This will help to speed up and reduce the size of your database.

Solution:

```
1 | DELETE FROM wp_postmeta WHERE meta_key = 'your-meta-key';
```

Export all Comment Emails with no Duplicate

Over a period of time, your blog will have received many comments. These comments will include the email addresses left by the commenter. You can retrieve all these emails for your mailing list without any duplicate.

Solution:

```
1 | SELECT DISTINCT comment_author_email FROM wp_comments;
```

Once you have the result, under **Query results operations**, select export to **export** all the emails in phpMyAdmin.

Get the latest updates on new design and development resources for free!

Solution:

```
1 | DELETE FROM wp_comments WHERE comment_type = 'pingback';
```

Delete all Spam Comments

If you have plenty of spam comments, going through each page to delete spam can be tedious and frustrating. With the following SQL query, even if you have to face deleting 500 over spam comments, it will be a breeze.

Solution:

```
1 | DELETE FROM wp_comments WHERE comment_approved = 'spam';
```

- 0 = Comment Awaiting Moderation
- 1 = Approved Comment
- spam = Comment marked as Spam

Identify Unused Tags

In a WordPress database, if you run a query to delete old posts manually from MySQL, the old tags will remain and appear in your tag cloud/listing. This query allows you to identify the unused tags.

Solution:

```
1 | SELECT * From wp_terms wt
2 | INNER JOIN wp_term_taxonomy wtt ON wt.term_id=wtt.term_id WHERE wtt.taxonomy='post_
```

Start Querying!

If you need to do some maintenance and clean up or move WordPress across domains, the above SQL queries can be useful and help speed things up for you. If you have any **additional handy SQL queries for WordPress**, please share it with us below.

I made a quick snippet to change url:

```
//no secret, just put your old url and new
```

```
set @oldurl = 'http://oldwp-url.com', @newurl = 'http://newwp-url.com';
```

```
UPDATE wp_options SET option_value = replace(option_value, @oldurl, @newurl) WHERE option_name = 'home' OR option_name = 'siteurl';
```

```
UPDATE wp_posts SET guid = REPLACE (guid, @oldurl, @newurl);
```

```
UPDATE wp_posts SET post_content = REPLACE (post_content, @oldurl, @newurl);
```

```
UPDATE wp_posts SET post_content = REPLACE (post_content, CONCAT('src=', @oldurl), CONCAT('src=', @newurl));
```

```
UPDATE wp_posts SET guid = REPLACE (guid, @oldurl, @newurl) WHERE post_type = 'attachment';
```

```
UPDATE wp_postmeta SET meta_value = REPLACE (meta_value, @oldurl, @newurl);
```

If any ones interested I wrote a small util for renaming urls based on your queries. It gets an old url and a new url and prints out the relevant queries for a rename.

John (Jean C) · 3 years ago

Am a newbie at web design and have an interesting problem. It's a long story but in a nutshell, have transferred a site from a local host to a shared host and failed to notice that my transfer tools had some exclusions. I ended up with a site which does not have any tables for comments or commentsmeta.

Is there any way to add the missing tables without overwriting the entire database?

^ | v · Reply · Share ›

Sajjad Ali · 4 years ago

The look so great i think these can really help out in future as well..!! but there might be many new things you can do now in WP SQL queries

^ | v · Reply · Share ›

Eoin · 4 years ago

Yea, but is there any plugins that just allow you to update a table, I know of Table Reloaded but it isnt saved in a editable sort-of-way table, more like in one row. SQL is great for some of these changes I just dont get the URL change ones surely you can export FIND>REPLACE the IMPORT.

how about restoring the database (sql) uploaded on FTP, then using an SQL query?

am i using the right command?

```
mysql -u YOURUSERNAME -p YOURPASSWORD < PATHTOSQL.sql
```

however, i'm getting this error:

#1064 - You have an error in your SQL syntax; check the manual that corresponds to your MySQL server version for the right syntax to use near blahblahblah.... at line 1

please help!

^ | v · Reply · Share ›

Chris · 4 years ago

I need your guidance on providing the query strings for the following :

1. I wanted to delete older posts from 2008 to 2010 in the database as it's bloated to over 400mb and a problem when backing up and importing into database. Deleting these would lighten this table and the dump as a whole.

2. What is the query string to do the above?

3. What's the query string to delete any relevant traces related to all the deleted posts thereafter such as comments of the deleted posts, unused tags?

Your kind assistance with your answers to the above, would be much appreciated.

Ron · 4 years ago

My client has been using a custom field "publication_date" for posts that are actually news articles. Now he wants to copy this publication_date to the posting date in about 100 posts/articles. Any SQL query for this?

And, a plug for "Search and Replace" plugin. Awesome tool!

Do you know a query to reset WP data to it's original form, this includes removing all dummy content and postmetas?

^ | v · Reply · Share ›

AustinCoulson · 4 years ago

Several of these queries are awesome for post host transfer updates. I know you change the URL via admin before moving it etc, but these are nice too! Thanks!

^ | v · Reply · Share ›

Mayur · 5 years ago

an awesome query list !!

Thanks a lot :)

^ | v · Reply · Share ›

Samuel · 5 years ago

Hello All.

Came across the site from google and though it has a lot of queries, I still can't find the one I'm looking for and i'm hoping someone might help.

What I'm trying to do, is delete a user and all posts related to that user. I ran "DELETE FROM `impactra_wrdpn`.`wp_users` WHERE `wp_users`.`ID` = theuserid" though user got deleted, the posts were still on the site. I know I could do it from admin backend but my allocation is not allowing me and these are all spam posts :(

Please advice and Thanks in advance

Samuel

^ | v · Reply · Share ›

Michael Otton · 5 years ago

Finally some really useful info. Thankyou very much

^ | v · Reply · Share ›

Alan · 5 years ago

I have used your queries before many times but only when moving wordpress sites/databases around on external hotsing not to my Ubuntu server which is what I want to do now. Normally goes well - just create a new site and database - import the old sql file to create the tables and then run the queries - in this case primarily changing <http://www.myoldhostname.co.uk> to http://localhost.

In the past when I have run the site for the first time with the new structure it goes straight in but this time I am being given the WordPress Welcome screen. Any thoughts. wp-config is correct becasue I delete all the newly created tables before importing the old sql file.

^ | v · Reply · Share ›

mike · 5 years ago

hey buddy.. you approved my comment but didn't pay attention to what am I asking. No response...

^ | v · Reply · Share ›

Get the latest updates on new design and development resources for free!

This is a great one..nice article, thanks for share with us... I learn a lot with your words.. thank for the post.

^ | v · Reply · Share ›

David · 5 years ago

Why can't you search the entire database, and replace "http://localhost/oldsite" with "<http://www.newsite.com>" wherever it appears?

I guess I haven't tested in enough circumstanced, but I believe I've seen plugins do that as well. To do the same thing, since I'm exporting/importing the file anyway, while it's on my computer, I open it a text editor and do the find and replace.

Anyway, just my thought. Of course site url and home url are often different, depending on install folder but that's done after the fact.

^ | v · Reply · Share ›

Daytona Beach Lawyer · 5 years ago

Nice post bud. No wonder this is one of the most popular ones going on!
